# Understanding Domain DNS Settings

## What to know

DNS maps a domain name to the hosting service. BeatKongs plans to use Cloudflare for edge routing and custom-domain provisioning.

## Steps

1. Locate the DNS records specifically supplied for your domain in Settings → Domain & SSL.
2. Make those changes with your domain’s DNS provider.
3. Do not delete unrelated records such as email MX, SPF, DKIM, or verification records.

**Review note:** This article is based on BeatKongs product decisions and known dashboard sections. Confirm exact labels and feature availability in the current interface before publishing.

## Need help?

If the described option is missing, record the affected page, your workspace, and the expected behavior. Use the Report Issues option in your producer dashboard to contact BeatKongs Support.
