How to Add a Beat Browser to Your Website

What to know

- The native BeatKongs Player Engine supports playback, seeking, queue management, and cross-page playback restoration.
- Beat Browser blocks display beats and support search, filters, sorting, pagination, and artwork.
- The shared license modal presents licenses enabled for the beat, with their producer-defined prices and delivery settings.
- Sticky Player, wishlist, and sharing features are part of the BeatKongs player system.
- External-player mode depends on third-party embed behavior and may not provide all native player features.

How to check this in your account

1. Open Website → Edit Website in your producer dashboard.
2. Locate the relevant Beat Browser or player block, or open the player settings for the feature being described.
3. Use a saved beat with valid media and enabled licenses to test the feature.
4. Save changes and verify the behavior on the published storefront, including mobile.

Review before publication: Exact buttons and settings must be checked against the current BeatKongs dashboard. This draft does not claim unverified live behavior.

Need help?

Record the relevant page URL, beat title, license, or order number, along with what happened and what you expected, when contacting BeatKongs Support.
